

Soil parameterization

Posted by florian - 2010/04/14 13:15

Hi all,

I'm new in AGWA and have some questions about the parameterization of the soil for a very small watershed.

AGWA could support 3 types of soil classifications: STATSGO, SSURGO, and FAO.

My problem is that I do not have the tables for the region in which I am interested. So I would like to create my own. These tables have many parameters and I don't know what these mean and if there are all useful?

Could somebody please tell me which parameters of these tables (especially FAO) are essential to AGWA to parameterize the soil?

I would be very grateful for any advice.

Thanks, Florian
